Bibliographies in the Quick Bibliography Series of the National Agricultural Library, are intended primarily for current awareness, and as the title of the series implies, are not indepth exhaustive bibliographies on any given subject. However, the citations are a substantial resource for recent investigations on a given topic. They also serve the purpose of bringing the literature of agriculture to the interested user who, in many cases, could not access it by any other means. The bibliographies are derived from computerized on-line searches of the AGRICOLA data base. Timeliness of topic and evidence of extensive interest are the selection criteria.

The author/searcher determines the purpose, length, and search strategy of the Quick Bibliography. Information regarding these is available upon request from the author/searcher.

Copies of this bibliography may be made or used for distribution without prior approval. The inclusion or omission of a particular publication or citation may not be construed as endorsement or disapproval.

To request a copy of a bibliography in this series, send the title, series number and self-addressed gummed label to:

Extract: In this study economic and environmental analyses of manure handling systems have implications for programs to regulate agricultural nonpoint sources of water pollution and programs to subsidize manure handling practices. Previous economic analyses in the literature are discussed. Manure systens are evaluated in a consistent framework to determine construction and operating costs. The effect of soil type on nutrient conservation is examined for two hypothetical farms. Dissolved phosphorous runoff is estimated for the farms varying storage capacity and soil type. Costs of phosphorus reduction by handling system, housing type and soil type are examined. Conclusions for cost-sharing policy are drawn.
